The cost-effective care bed

Dali II 24 Volt - The cost-effective care bed

Advantages at a glance

Quality and durability

The "Dali II 24 Volt" care bed is sturdily constructed to stand up to the rigours of daily care. High-quality components make this a particularly durable, sturdy and low-maintenance care bed that significantly reduces follow-on costs.

Cost-effective / Easily assembled by just one person

This bed offers exceptional value for money, but not at the expense of materials or design. The uncompromising use of high-quality materials is a hallmark of the Burmeier philosophy. The care bed can be assembled and disassembled by one person without tools in a matter of minutes.

24 volt drive system available as standard

For the 24 volt drive system, the maintenance interval can be extended to 2 years, and the interval for the required leakage current measurement can even be extended to a maximum of 10 years. The conditions for this can be obtained from Burmeier – please refer to the Operating Instructions. Since all live 230 volt components are located separately from the care bed, this system offers optimum safety for the occupant.

Safety side fall protection height approx. 38 cm

Mattresses and anti-decubitus systems up to a maximum thickness of 16 cm can be used without the need for adjustable safety side height extensions. In many cases costly height extensions are not required at all.

Design details

Reverse-Trendelenburg position

Dali II with metal safety sides (model 15.0624.11)

Electronic switch mode power supply unit integrated immediately downstream of the mains plug

Power socket for connecting the electrical power supply unit (switch mode)
